

Question 3

Use the method `value_counts` to count the number of houses with unique floor values, use the method `.to_frame()` to convert it to a dataframe.

```
[29]: floor_counts = df['floors'].value_counts().to_frame()
      floor_counts.rename(columns={'floors': 'value_counts'}, inplace=True)
      floor_counts.index.name = 'floors'
      floor_counts
```

[29]:

	value_counts
floors	
1.0	10680
2.0	8241
1.5	1910
3.0	613
2.5	161
